

CANADA'S #1 CHOICE FOR CONCUSSION BASELINE TESTING

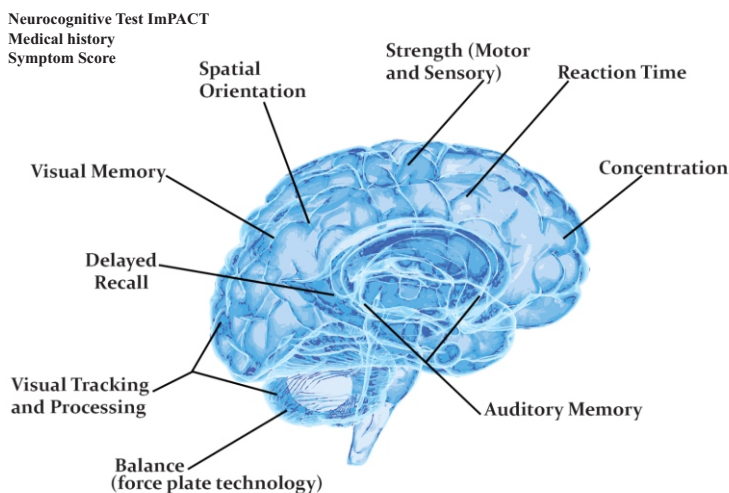

WHY GET TESTED?

Concussions are an unfortunate incident in sports. A baseline test measures areas of brain function that could become affected following a concussion. If and when an athlete sustains a concussion, one can compare their post-injury state to baseline parameters to ensure:

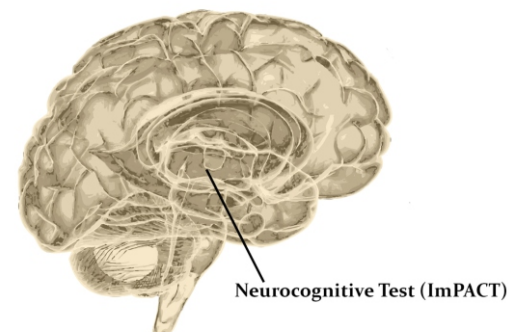

- an accurate diagnosis is made,
- the affected brain area is determined,
- complete brain recovery **, and
- safe return-to-sport, work/school or play.

** Secondary concussions prior to full recovery may cause long-term or cumulative brain damage. Without baseline parameters, clinicians cannot determine brain recovery.
